

positive and negative environmental impacts associated with

natural bamboo

See also manmade bamboo below

Natural bamboo is a natural fiber derived from the stem of the bamboo plant.

	<ul style="list-style-type: none">• rapidly-renewable resource• can grow with virtually no fertilizers or water• fiber is used in its least-processed state• if the plant is cut by hand and left to rot in the ditch, then the environmental impact is minimal• reusable and biodegradable
	<ul style="list-style-type: none">• no local sources available for commercial use• mechanical methods of harvesting have adverse effects on the environment• water retting process produces highly polluting wastewater• use of enzymes and water increases biochemical oxygen demand (BOD) and eutrophication of waterways
